

Infinite Loop Detection

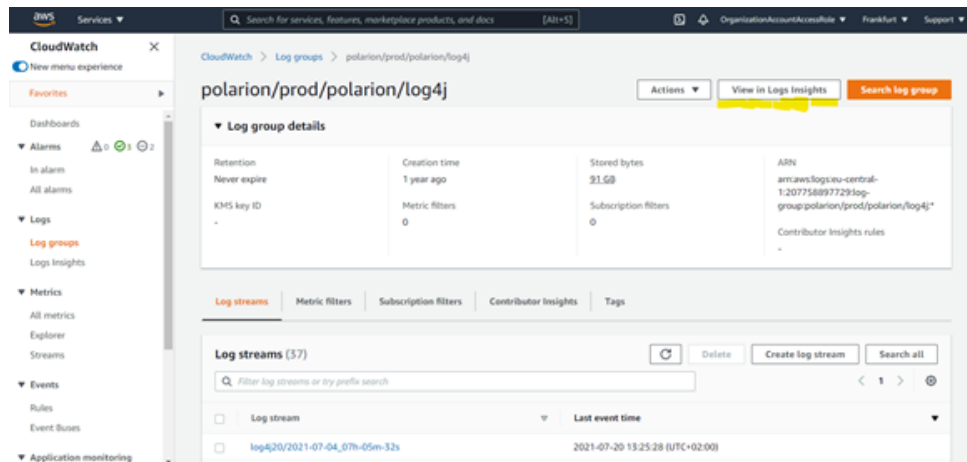

Step	Summary /Description
1	Send Notification to AD team and IMS team 1.Check Logs Using below mention procedure if the query has found any occurrences of this message (Infinite). Email Template Subject: - Polaron Infinite Loop Detected – Immediate Investigation Required Dear [System Owner/Team], An Infinite Loop Detection Alert (High Severity) has been triggered in the Polarion production environment. This indicates that a process or execution flow may be stuck in a continuous loop, which can significantly impact system performance and may lead to service degradation or unresponsiveness if not addressed immediately. Details: • Alarm Type: Infinite Loop Detection • Severity: High • Environment: Production • Timestamp: [Insert Date & Time] Thank you Best regards, [Your Name] Polarion AMS

Procedure

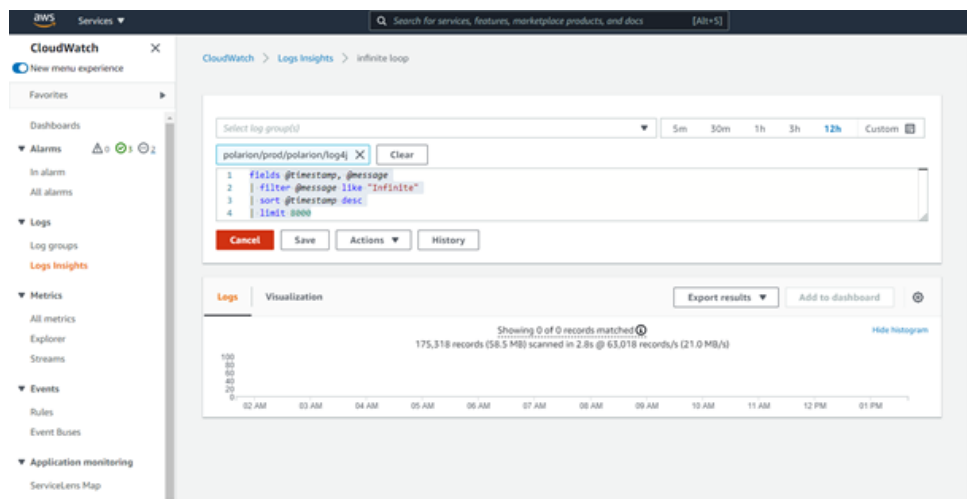

1. An automated Alarm for this check is already created. Updates will be seen here ([CloudWatch Alarm Automation](#)).
2. Open cloud management console and open log polarion/prod/polarion/log4j in the list of log groups:

3. Click the button "View in log insights":

4. Execute the following query: use query interval 12 hours
 - fields @timestamp, @message
 - | filter @message like "Infinite"
 - | sort @timestamp desc
 - | limit 8000

Further details

- If a Support finds this "Infinite Loop?" independent of any value(not present!) we have to plan for a restart depending on disk space left and disk usage growth we might have up to 1 working day for a polarion services restart.
- Perhaps disk space expansion is a good option to get into the next maintenance window. (hint for recovery tea
