

Freezing and Unfreezing:

Refer PALM-3356 to know more about this issue.

The Workitem does not exist error.

When the migration happens, some WIs (already frozen at a particular revision in the source project) gives this error as they try to find the same old rev in the target project and do not get it.

We have 2 Options to solve this (confirm with end user which option they want before proceeding):

1. Unfreeze the WI and let it fetch the WI details from the target project now. (This will fetch the WI details from Target project)
2. Make changes as per below screenshot to the module.xml file, so that these WIs refers to the old revision of **Source project**.
Line that needs to be added after revision: `|project=source project id|serverPath=production/mirror link">`
