

Handling Work Item Attribute Fields Containing Only Links

Problem Statement:

Polarion treats a field as empty if it contains only a hyperlink without any textual content. Attempting to advance the work item to the next status under these conditions produces an error message.

Details:

- Example Field: Description in an automated Test Case
- Error Message: Displays the field's ID instead of its name.

Impact:

- The ID in the error message may be outdated or not immediately recognizable (e.g., Test_Regulations for "Reference documents").
- Misidentifying the field may cause delays in troubleshooting or processing work items.

Solution / Workaround:

1. Add textual content alongside any links in attribute fields.
2. Use the administration space to verify the field corresponding to the ID in the error message.
3. Alternatively, convert a WIB query to text format to identify the correct field.

Recommendation:

- Always provide descriptive text in attribute fields to ensure proper detection and avoid errors.
