

How to check SVN logs from EC2 CLI

Steps to connect EC2 instance:

1. Login to AWS using below.
link: [Amazon Web Services \(AWS\)](#)
2. Expand FMCNA-Polarion-Development and click on **AOPermissions**.

3. Search for EC2 and click on it.
4. Click on instances.
5. Search for PROD and check on it and click on **connect**.
6. Click on **session manager** and then connect it.
7. After clicking on connect, you will get console of session manager.
8. Give command "**sudo su**"
9. Give "**docker ps**"
10. Give "**docker exec -it (first four of container-id) /bin/bash**"

Commands to fetch logs:

1. `svn log -l 1 file:///opt/polarion/data/svn/repo/` This shows last rev changes on the file.
2. `svn log -l 1 --diff file:///opt/polarion/data/svn/repo/` This shows last rev changes on the file in details (-diff is for detailed differences).
3. `svn log -r 4315087 --diff file:///opt/polarion/data/svn/repo/` This shows changes on the file in a particular rev (-r {rev number} is for changes in a particular rev).
4. `svn log -vq -r 100 file:///opt/polarion/data/svn/repo/` This shows changes on the file in a particular rev (-vq will list only changes and no other file).
5. `svn log -vq -r 100:110 file:///opt/polarion/data/svn/repo/` 100:110 is for changes in between these revs.
6. `svn log -vq -r 100 file:///opt/polarion/data/svn/repo/<project path or specific file path>` This will be for changes in particular file or project.
