

How to make changes from SVN

Step	Action	Screenshot
1	Create a new folder in file manager with the ticket number that we received.	
2	Create three new folders inside newly created folder and name them as backup , old revision , and checkout .	
3	Export workitem.xml (for Work item) / module.xml (for documents) of the latest/head revision of workitem /document to the backup folder as per below screenshot.	
4	To go to requested revision of workitem/document follow these steps. ->Click on head revision ->Click on revision -> Give revision number that need to be reverted. -> Click on ok -> Old revision workitem.xml file will be opened.	
5	Export workitem.xml of the requested revision of workitem /document to the old revision folder as per below screenshot.	
6	Then go to head revision, and right click on the workitem and then click on checkout , Export all files of the checkout of workitem/document to the checkout folder.	

7	To revert to requested revision, copy all the content from the old revision folder and then replace all the files in checkout folder with the copied content.	
8	To commit the changes, right click on checkout folder, you will find SVN commit.	
9	Click on SVN commit, then write a message as per the request along with ticket number and check all the files and click on OK. Special Case: 1. While committing, check if the comment.xml file shows the status as unversioned or modified. If it is unversioned rename the comment.xml file E.g. comment-6.xml to comment-12.xml 2. Make sure the renamed file name should not be existing in the entire Work item history. 3. Once renaming is done, then workitem.xml should also be updated with the same id. Piece of code that need to be updated in workitem.xml is <code><item id="secureApprovalCommentId">12</item></code> Note: If we do not take proper action on comment.xml file. It affects the workitem's revision history. It doesn't show the Revision history and it shows error as per screenshot.	

10	For Document properties, we work with module.xml files, Steps same as mentioned above.	
11	How to checks logs in SVN for any file? Right click on workitem/document and click on show log.	
12	In the logs you want to check, click on compare with previous revision. This opens 2 files/revisions to show the difference in them.	
13	How to make changes to attributes of any Workitem or Document? Checkout the xml file and edit it (make changes to the attributes and save). Then commit it back.
