

Index checker Job fix

steps

Step	Action	Screenshot
1	When the Index Checker job fails, we get some errors in the Log file. We follow the below mentioned steps to fix it. Steps to be performed to analyze Polaron logs: 1. Analyze the Index Checker Job logs to identify the cause of job failure and confirm that job gets failed due to the incorrectly deleted work items.	 The screenshot displays a log file with multiple entries from 'Worker-24: Index Checker'. The logs show the process of checking various projects like 'nondclwpPlayground', 'Sandbox', 'Sirius_Treatment_System', 'Disinfectants', 'PMK', 'comH', and 'HPI'. At the bottom, a red error message states: 'WARN: [project:4008APackage2] 1 of 53768 workitems not found in index: X008-20378, X008-24596, 4AP2-38295' and 'ERROR: [project:4008APackage2] 3 workitems not found in index after refresh: X008-20378, X008-24596, 4AP2-38295'. Below this, it says 'Status of job "Index Checker" changed to FINISHED' and 'Status of job "Index Checker" is FAILED: 1 Errors, 1 Warnings, 0 Information.' ((fig-1.1))
2	Steps to be performed in SVN: 1. In the SVN, check if these work items were deleted incorrectly. Follow below steps to check: a. Identify the project in which workitems are deleted incorrectly, by checking prefix of workitems from the index checker job logs. b. Then Go to that project in SVN. c. Check the logs of that project in time frame before the index checker job failed. Ex: If job failed today, the after last successful index checker run that is yesterday's logs. d. As per below screenshot the item 4AP2-38295 is deleted at revision 3195526. e. You can get the exact location from the path as per below screenshot. (Here the item present in _Temporary_items_and_trash document) f. If you find deleted in the action, then you can confirm the items got deleted. 2. After that recover the deleted items. To recover, follow the below steps: a. In SVN, note the revision when they were deleted (example here the WI was deleted in 3195562 revision) b. Open the revision when the WI was present in the system (3195562 -1) i.e. 3195561 in this case. c. Export the work items on your local machine. 3. Open SVN at head revision again and checkout the work items folder under the Document in which the work item was present before deletion. 4. Add the deleted work item to the folder and check in (SVN commit).	 The screenshot shows the 'Log Messages - TortoiseSVN' window. It lists several commits. The commit at revision 3195562, dated Monday, 18. September 2023 13:52:10, is highlighted. The message for this commit is 'Polarion commit Mon Sep 18 11:52:09 UTC 2023 [3c1480e116f448c0b511b0335309a20e]'. Below the log, a table shows the changes: the path '/X008/4008APackage2/modules/Requirements/_TEMPORARY_ITEMS_AND_TRASH/workitems/4AP2-38295' is listed as 'Deleted'. (fig-2.1)  The screenshot shows a file explorer window with the path 'This PC > Documents > Mirror > PALM-4555 > export'. It displays three folders: '4AP2-38295', 'X008-20378', and 'X008-24596', all dated 9/21/2023. (fig-2.2)

Steps to be performed in Polaron via UI:

1. Open the Work item and remove all the links and remove it from referenced documents and delete it again.

2. Run the Check Index job for the project. It should not show any error.

3. Also check the default Index Checker job of next day. If it passes, the issue is fixed.

Index

You may need to use these index repair actions in some rare situations - to recover from unexpected server shutdown caused by huge servers. They will not block users, but some slowdown may be experienced. Please use the [Monitor](#) topic to see the status.
