

Restoring of Synchronizer Folder Manually

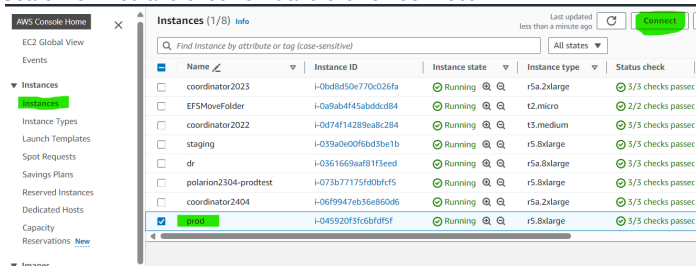

Note: Follow below steps to restore synchronizer folder manually.

Step1: AWS connecting

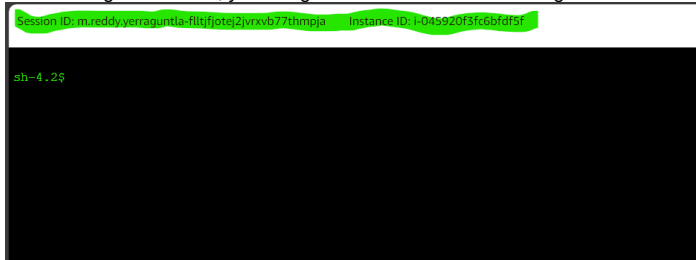

- Login to AWS.
- Expand FMCNA-Polarion-Production and click on **AO Permissions**.

- Search for EC2 and click on it.
- Click on instances.
- Search for Prod and check on it and click on **connect**.

- Click on **session manager** and then connect it.
- After clicking on connect, you will get console of session manager.

Step2: Commands

- **sudo su**
- **docker ps**
- **docker exec -it (first four of container-id) /bin/bash**
- **cd data**

```
sh-4.2$ sudo su
[root@prod-polarion-prod bin]# docker ps
CONTAINER ID   IMAGE
PORTS          NAMES
51c2db4a52a7   707924879715.dkr.ecr.eu-central-1.amazonaws.com/pol
ecs-polarion-alm-prod-PolarionTaskDefinition-dH4i
b8861b8fb035   amazon/amazon-ecs-pause:0.1.0
ecs-polarion-alm-prod-PolarionTaskDefinition-dH4i
c1fa69aa11a5   amazon/amazon-ecs-agent:latest
ecs-agent
[root@prod-polarion-prod bin]# docker exec -it 51c2 /bin/bash
root@ip-10-40-249-249:/opt/polarion# cd data
```

- We already have synchronizer.zip file in our support bucket dev, we have to copy it to prod environment, to copy use below command.

```
aws s3 cp s3://supportbucketdev/synchronizer.zip /opt/polarion/data
```

- Then unzip the synchronizer folder by using this command **unzip synchronizer.zip -d /opt/polarion/data/**

```
root@ip-10-40-249-249:/opt/polarion/data# ls
DIR RR TCP_WorkingCopies logs oauth_consumer_store.xml postgres-data shared-maven-repo svn synchronizer synchronizer.zip tatooldata temp_cr1406x workspace
```

- Now we have set Owner and Group permissions to entire synchronizer folder, for that please use below command, and it applies to all folders under synchronizer.

```
chown -R polarion:www-data ./synchronizer
```

```
root@ip-10-40-249-249:/opt/polarion/data# chown -R polarion:www-data ./synchronizer
```
